Building Reports, Dashboards, and Custom Pages (UI Builder) for the Application

Patient Appointment Booking Form — Reporting & Dashboard Use Case

Akshat Singh

1. Aim

To build multiple report views — a Kanban report grouped by Department and a Calendar report for daily scheduling — on top of the Appointment_Booking_Form, and to design a custom Dashboard page using Zoho Creator's UI Builder (Page Builder) that gives the front desk and doctors an at-a-glance view of appointment volume, age distribution, and department-wise load.

This addresses the clinic's need to move from a flat list of bookings to visual, role-friendly views that make it easy to see today's schedule, spot departmental bottlenecks, and track overall booking trends without opening every record individually.

2. Procedure

Step 1: Create the Kanban report — A new report named department_view was added on the Appointment_Booking_Form and its type was set to Kanban.

Step 2: Configure Kanban properties — In the Report Builder, Group Columns By was set to Department so each column represents one department (General Medicine, Cardiology, Dermatology, Pediatrics, Orthopedics), with Empty Value Column and Deleted Value Column hidden for a clean view.

Step 3: Create the Calendar report — A second report, Todays_Appointments, was added and its type was set to Calendar to visualise bookings across a month/week/day grid.

Step 4: Configure Calendar properties — The Event title and both Event starts on / Event ends on fields were bound to Preferred_Appointment_Date, and the Default view was set to Month with the week starting on Sunday.

Step 5: Open the Page Builder — A new custom page named Dashboard was created for the application using Zoho Creator's Page Builder (UI Builder), which exposes a palette of elements — Panel, Board, Chart, Gauge, Search, Form, Report, Snippets, Button, and Widgets.

Step 6: Add a title panel — A Panel element was placed at the top of the page and configured with the heading “Patient Dashboard” and a welcome label to personalise the page for the logged-in user.

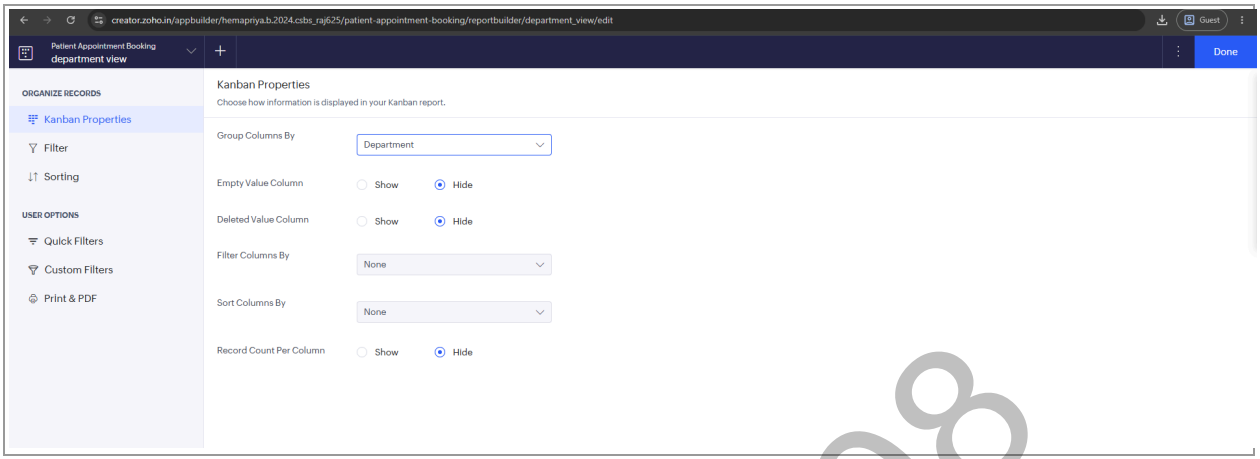

Step 7: Add chart widgets — Two Chart elements were added below the panel: a Donut chart summarising Appointment Booking Form submissions by date, and a Bar chart plotting patient count against Age.

Step 8: Embed the report grid — A Report element bound to the Appointment_Booking_Form Report was added beneath the charts so the dashboard also lists the underlying records in one place.

3. Output

3.1 Report Builder — Kanban Properties for “department view”

The Kanban Properties panel shows Group Columns By set to Department, with Empty Value Column, Deleted Value Column, and Record Count Per Column all set to Hide for a clean board. This is where the department-wise grouping used in the live Kanban report is configured.

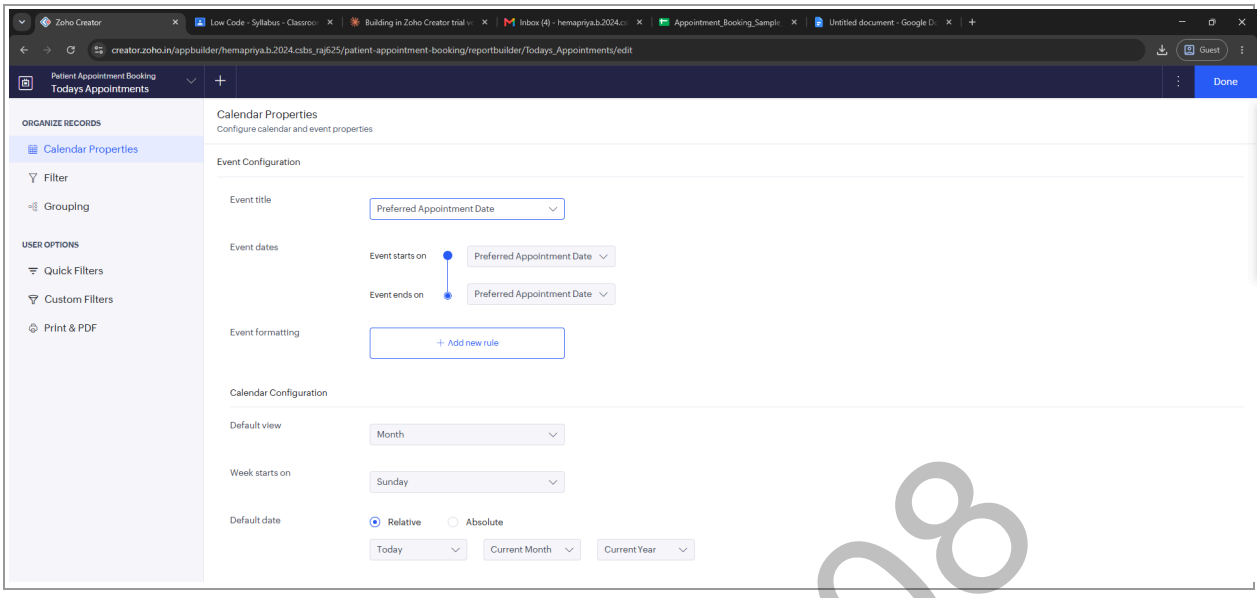

3.2 Live Kanban report — “department view”

The published department view report displays one column per department, with each patient card (name and age) sitting under its booked department — Cardiology shows two sample patients while General Medicine, Dermatology, and Pediatrics currently have no records, confirming the grouping works as configured.

3.3 Report Builder — Calendar Properties for “Todays Appointments”

The Calendar Properties panel binds the Event title, Event starts on, and Event ends on fields to Preferred Appointment Date, with the Default view set to Month and the week starting on Sunday. This configuration drives how bookings are plotted on the calendar grid.

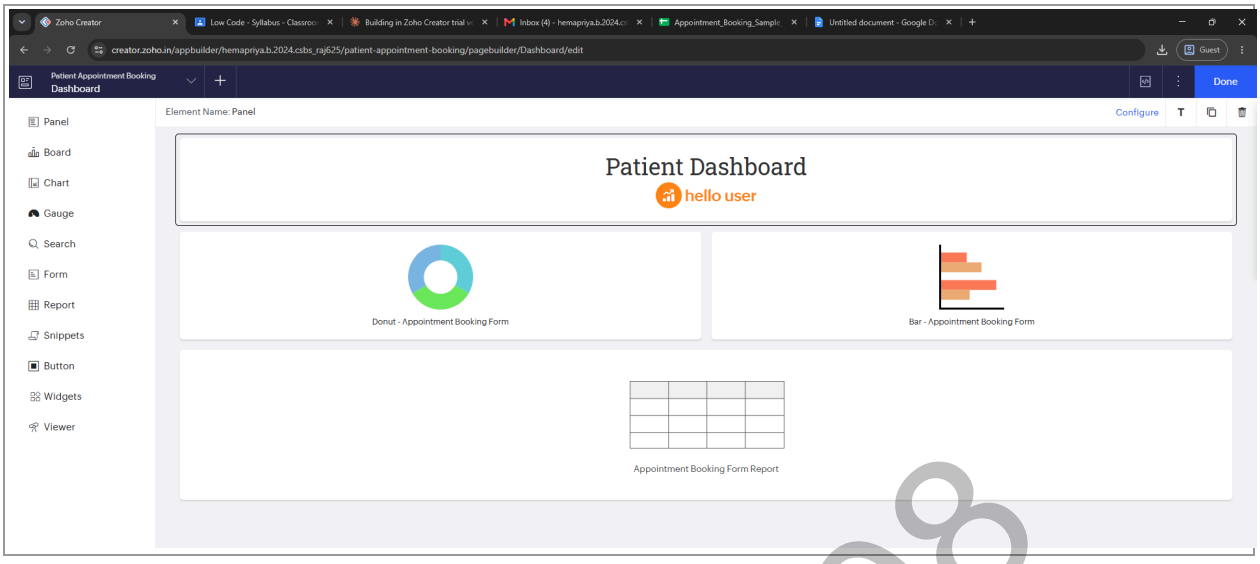

3.4 Live Calendar report — “Todays Appointments”

The published calendar shows August 2026 in Month view, with the two sample bookings plotted directly on their preferred dates (18-Aug-2026 and 22-Aug-2026). The sidebar also lists the other reports built on the form, including Department_Wise_Appointments and the department view Kanban.

3.5 Page Builder (UI Builder) — designing the Patient Dashboard

The Page Builder view shows the widget palette (Panel, Board, Chart, Gauge, Search, Form, Report, Snippets, Button, Widgets) on the left, and the Dashboard page under construction on the right: a title Panel, a Donut chart and a Bar chart both sourced from the Appointment Booking Form, and an embedded Report table placeholder.

3.6 Live custom page — "Patient Dashboard"

The published Dashboard page shows the "Patient Dashboard" title panel, a Donut chart splitting bookings by date and a Bar chart plotting patient age, followed by the live Appointment Booking Form Report grid listing both sample patients with their contact number and age — giving staff a single-screen summary of booking activity.

4. Final Result

Two additional report views were successfully built on the Appointment_Booking_Form: a Kanban report that groups appointments by Department for quick departmental triage, and a Calendar report that plots every booking on its preferred date for day-to-day scheduling.

A custom Dashboard page was designed using Zoho Creator's UI Builder, combining a title panel, a Donut chart, a Bar chart, and an embedded report grid into a single at-a-glance view of appointment activity and patient age distribution.

All three views were verified in live/preview mode with real sample data, confirming that the Kanban grouping, calendar date-binding, and dashboard widgets render correctly and pull live records from the Appointment_Booking_Form.

The exercise met its objective: the front desk and doctors now have three complementary, low-code views — grouped, scheduled, and summarised — built entirely without custom code, in place of scrolling through a single flat report.
